

Step 4 — Develop the solution

1

Create your branch

Create a new branch off the default branch named `golden-solution`.

2

Apply existing patches

Apply patches from the `existing-solution` branch so you have the full diff in your working tree.

3

Improve the solution

Use the existing solution as your starting point: keep what's strong, improve code quality, readability, or edge-case handling as you see fit.

4

Commit feature code only

Your first commit must contain **only the feature code** — no new tests yet. Temporarily remove any test additions from the patch before committing.

```
git checkout <default-branch> # e.g. main, master, dev
git pull
git checkout -b golden-solution
```

 Copy

After implementing the feature (and removing test changes from the commit):

```
git commit -am "[sol] feature code"
```

 Copy

Developing a Golden Solution

Developing the Golden Solution Branch for Project Helix

Check your work

You should have one [sol] commit on golden-solution with only feature code. For reference, see helix-00023 and helix-00045. Next: add the tests and make the [f2p] commit (Step 5).
