

Reviewer Guide

[Platform Basics](#)[Env Setup Review](#)[Full Solution Review](#)[Edge cases & rulings](#)

This is the first review layer. You validate the Docker infrastructure before golden solution work begins.

1

Check Pre-Validation Status

Open the PR on GitHub and verify that the Helix Pre-Validation CI checks have run.

If checks haven't triggered, the PR may not target the correct branch — it should be from `docker-golden-solution` into `main`.

Red flags: No CI checks visible. PR targets the wrong branch. PR has merge conflicts preventing checks from running.

2

Validate `.helix/` folder contents

Confirm the PR contains exactly three files in `.helix/`:

Dockerfile.helix — Must install `git` and `ca-certificates` via `apt-get` (Debian/Ubuntu) or `apk add` (Alpine/slim images).

run-tests-eval.sh — Must handle arguments correctly: no arguments = run all tests, comma-separated file paths = run only those specific tests. Must call the test runner directly (e.g. `pytest`, `jest`) — must NOT invoke Docker commands (`docker run`, `docker build`, `docker exec`).

metadata.json — Must exist. Content validation happens in Full Solution Review.

No extra files should be in `.helix/`.

3

Scope check

Run `gh pr diff <PR#> --name-only`. Every file must match one of:

- `.helix/Dockerfile.helix`, `.helix/run-tests-eval.sh`,
- `.helix/metadata.json`, `.github/workflows/build-push-gar.yml`,
- `.github/workflows/golden-solution-validation.yml`,
- `.github/workflows/helix-validation.yml`.

Any file outside these six paths → **Request Changes**. Do not edit in place; the fellow needs to clean up the branch.

Red flags: Source-code modifications. README or doc changes. .gitignore updates. Any file in `src/`, `app/`, `lib/`, etc.

4

Review CI check results

If pre-validation checks passed (green), the environment is correctly set up. If checks failed, reject the PR with feedback pointing to the specific failed check logs. Include what the logs indicate — don't just say "checks failed."

Red flags: Checks skipped or stuck in pending. Checks passed but with warnings in the logs about missing dependencies.

5

Merge

If checks pass and `.helix/` contents look correct, approve and merge the PR.

Do not merge if any checks are pending or failed — even if the files look fine. The CI must confirm the environment works.

See the Scoring rubric in the [Platform Basics](#) tab for grading criteria.
